# So far in the Scala courses...

### Focused on:

**Basics of Functional Programming.** Slowly building up on fundamentals.

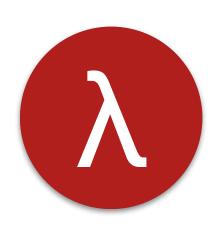

Parallelism. Experience with underlying execution in shared memory parallelism.

# So far in the Scala courses...

### Focused on:

**Basics of Functional Programming.** Slowly building up on fundamentals.

Parallelism. Experience with underlying execution in shared memory parallelism.

### This course:

Not a machine learning or data science course!

- This is a course about distributed data parallelism in Spark.
- Extending familiar functional abstractions like functional lists over large clusters.
- Context: analyzing large data sets.

## Normally:

Data science and analytics is done "in the small", in R/Python/MATLAB, etc

### **Normally:**

Data science and analytics is done "in the small", in R/Python/MATLAB, etc

If your dataset ever gets too large to fit into memory, these languages/frameworks won't allow you to scale. You've to reimplement everything in some other language or system.

### **Normally:**

Data science and analytics is done "in the small", in R/Python/MATLAB, etc

If your dataset ever gets too large to fit into memory, these languages/frameworks won't allow you to scale. You've to reimplement everything in some other language or system.

Oh yeah, there's also the massive shift in industry to data-oriented decision making too!

...and many applications are "data science in the large".

By using a language like Scala, it's easier to scale your small problem to the large with Spark, whose API is almost 1-to-1 with Scala's collections.

That is, by working in Scala, in a functional style, you can quickly scale your problem from one node to tens, hundreds, or even thousands by leveraging Spark, successful and performant large-scale data processing framework which looks a and feels a lot like Scala Collections!

# Why Spark?

### Spark is...

More expressive. APIs modeled after Scala collections. Look like functional lists! Richer, more composable operations possible than in MapReduce.

# Why Spark?

### Spark is...

- More expressive. APIs modeled after Scala collections. Look like functional lists! Richer, more composable operations possible than in MapReduce.
- Performant. Not only performant in terms of running time... But also in terms of developer productivity! Interactive!

# Why Spark?

### Spark is...

- More expressive. APIs modeled after Scala collections. Look like functional lists! Richer, more composable operations possible than in MapReduce.
- Performant. Not only performant in terms of running time... But also in terms of developer productivity! Interactive!
- Good for data science. Not just because of performance, but because it enables iteration, which is required by most algorithms in a data scientist's toolbox.

# Also good to know...

Spark and Scala skills are in extremely high demand!

# In this course you'll learn...

- Extending data parallel paradigm to the distributed case, using Spark.
- Spark's programming model
- Distributing computation, and cluster topology in Spark
- How to improve performance; data locality, how to avoid recomputation and shuffles in Spark.
- Relational operations with DataFrames and Datasets

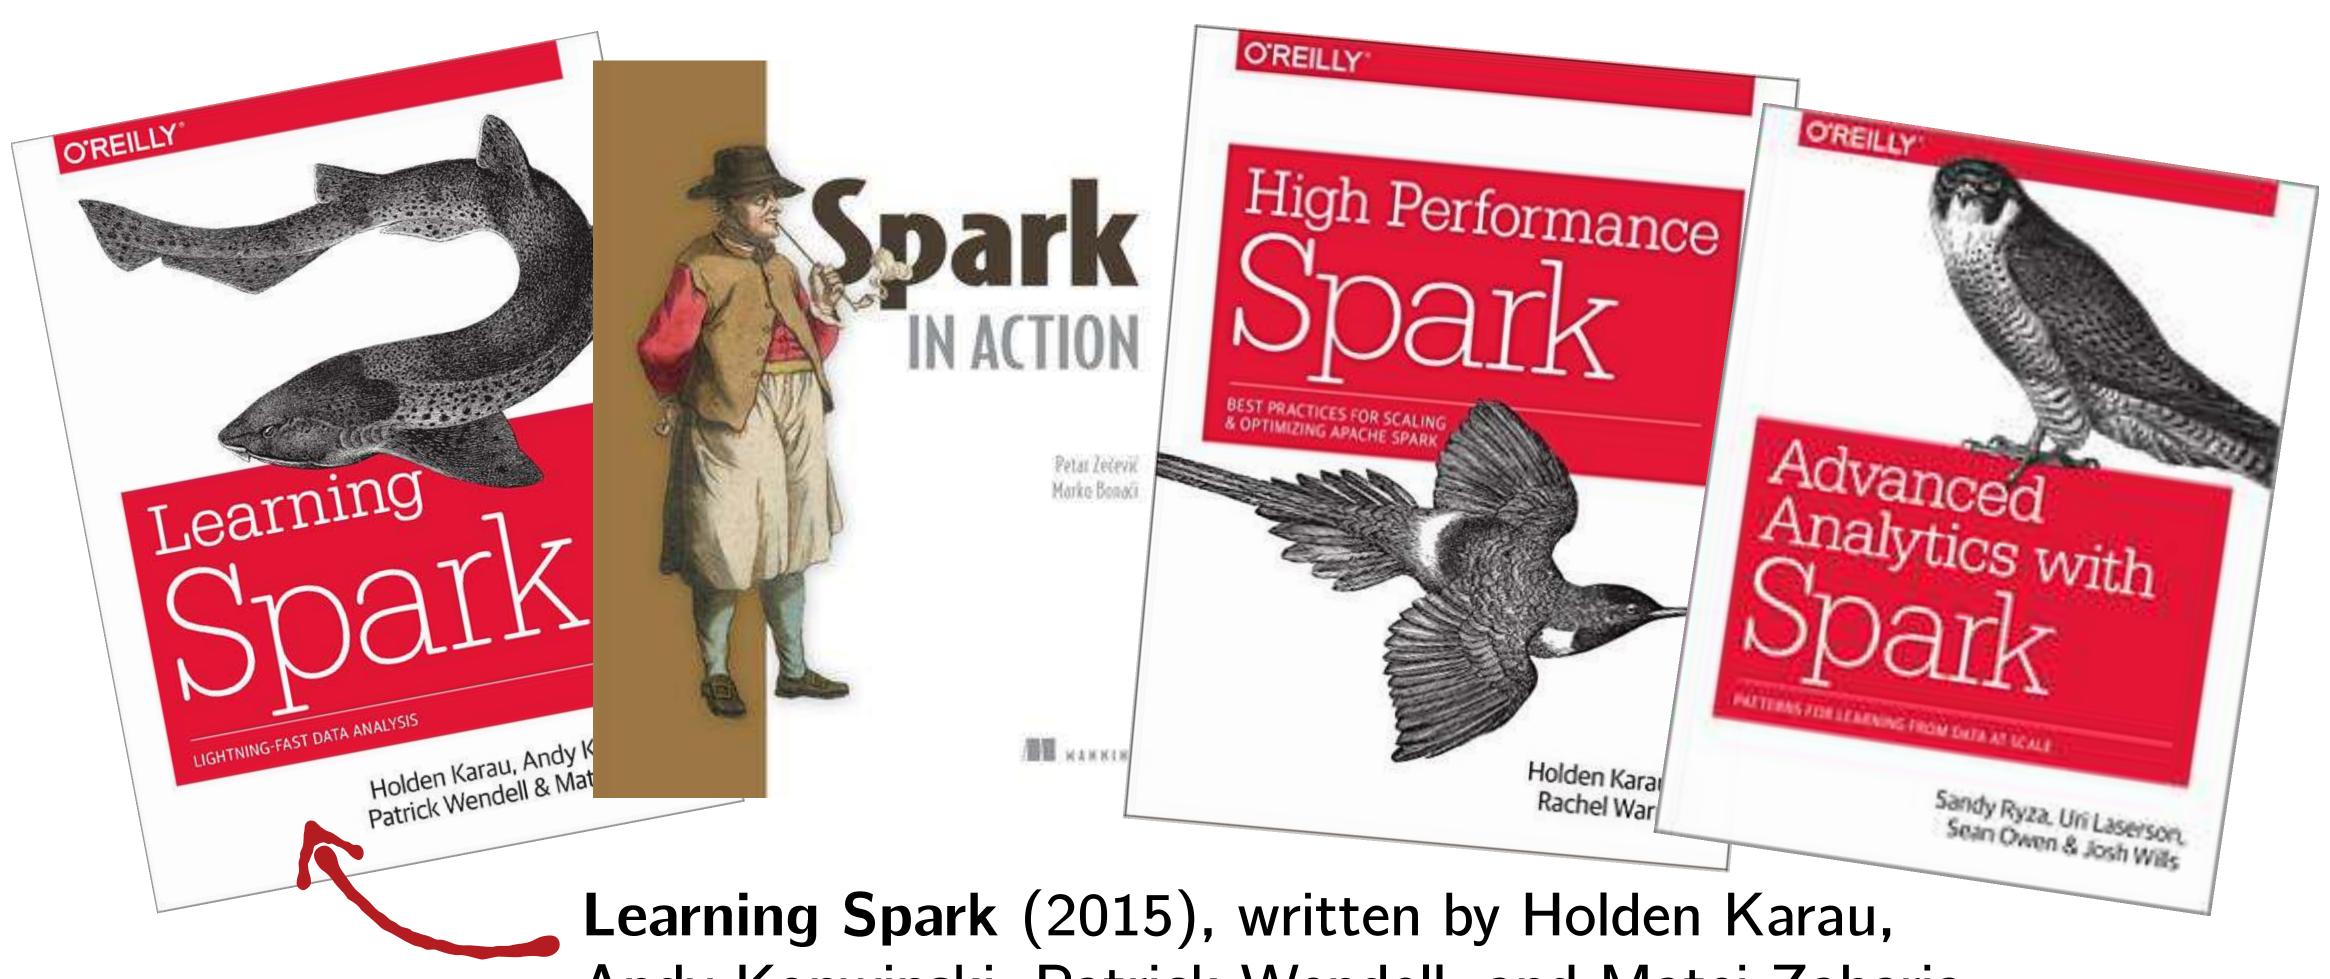

# Prerequisites

Builds on the material taught in the previous Scala courses.

- Principles of Functional Programming in Scala.
- Functional Program Design in Scala
- Parallel Programming (in Scala)

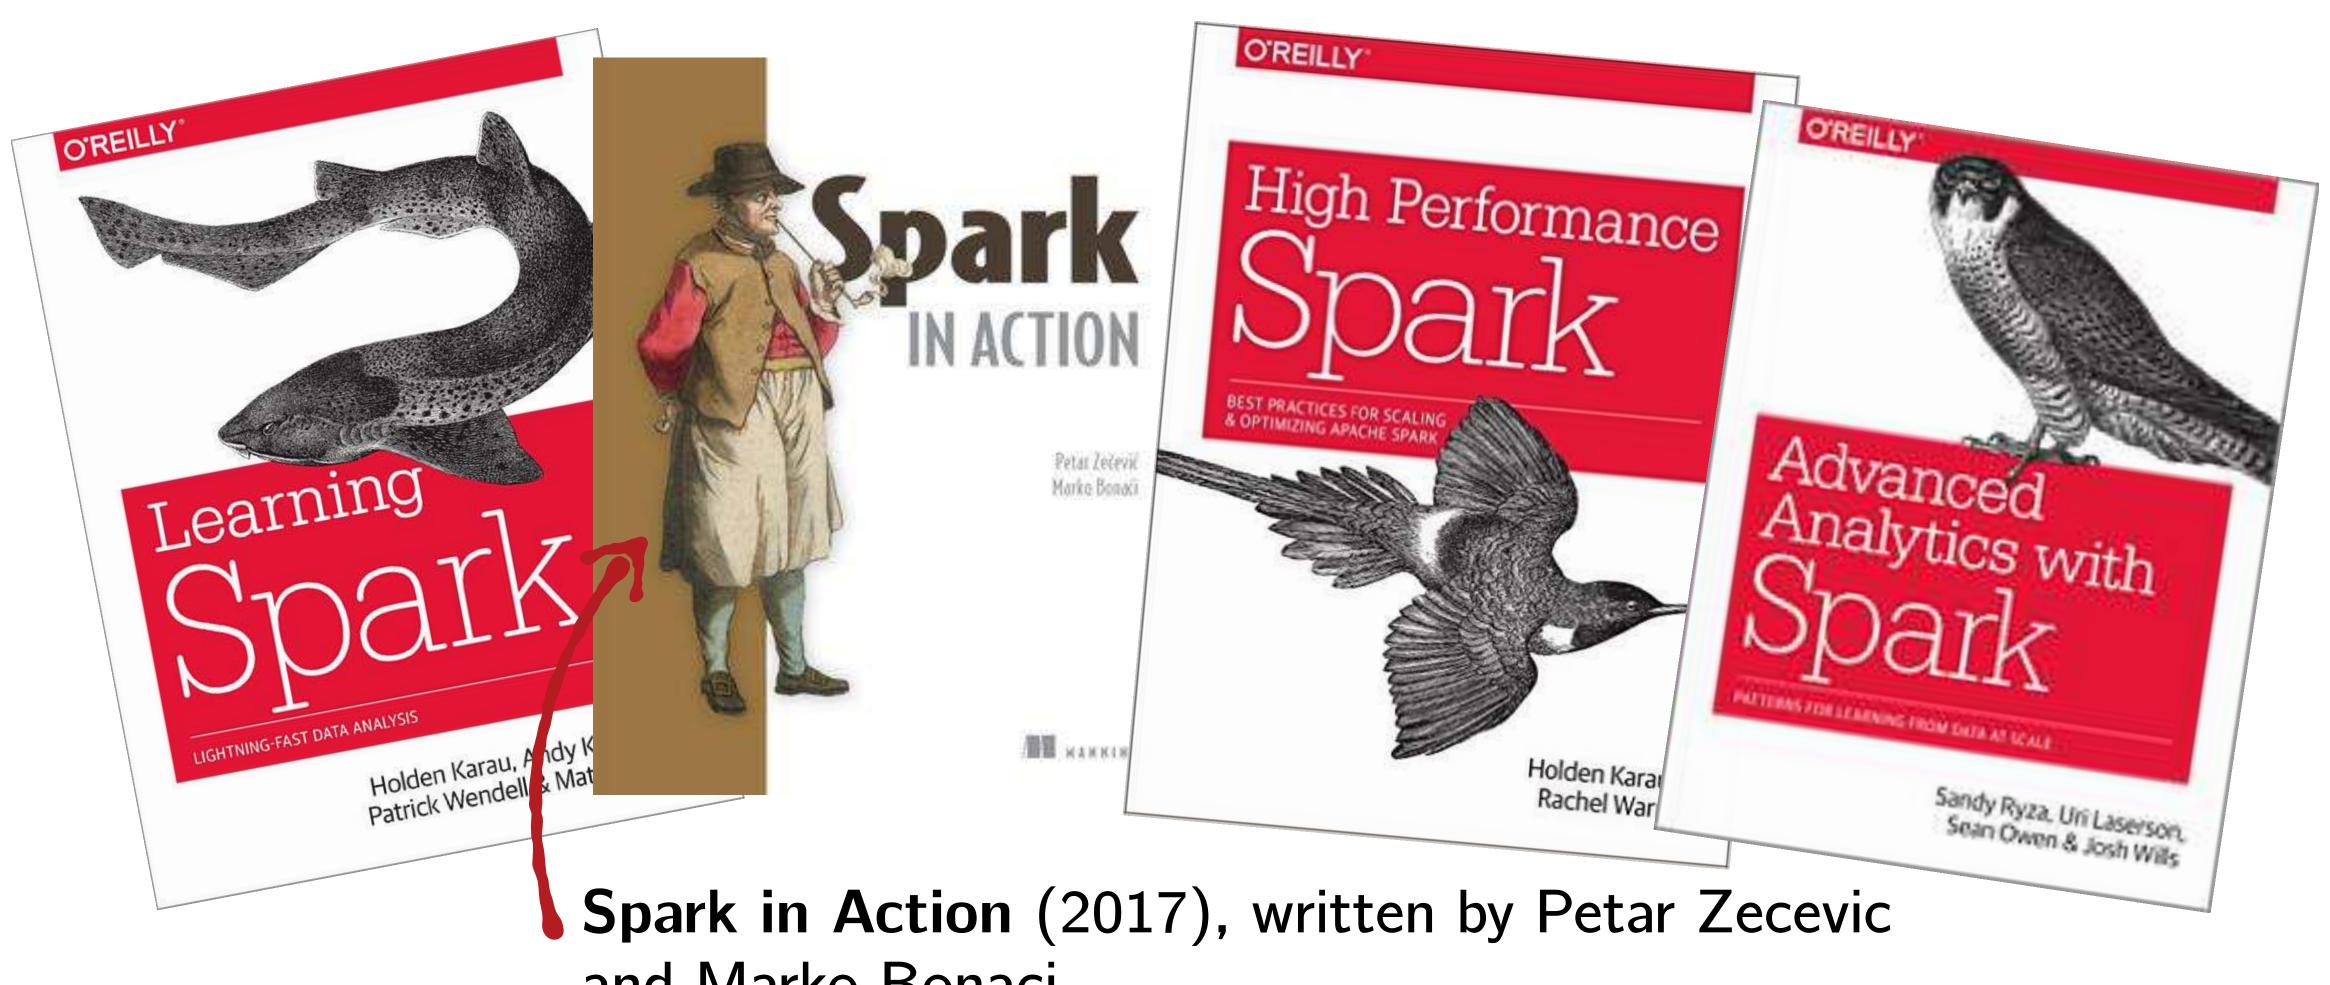

Or at minimum, some familiarity with Scala.

## Many excellent books released in the past year or two!

# **Mastering Apache Spark 2**

Welcome to Mastering Apache Spark 2 (aka #SparkLikePro)!

I'm Jacek Laskowski, an **independent consultant** who is passionate about **Apache Spark**, Apache Kafka, Scala, sbt (with some flavour of Apache Mesos, Hadoop YARN, and DC/OS). I lead Warsaw Scala Enthusiasts and Warsaw Spark meetups in Warsaw, Poland.

### Tools

### As in all other Scala courses...

- IDE of your choice
- sbt
- Databricks Community Edition (optional)

Free hosted in-browser Spark notebook. Spark "cluster" managed by Databricks so you don't have to worry about it. 6GB of memory for you to experiment with.

# Assignments

Like all other Scala courses, this course comes with autograders!

Course features 3 auto-graded assignments that require you to do analyses on real-life datasets.
